BACKGROUND

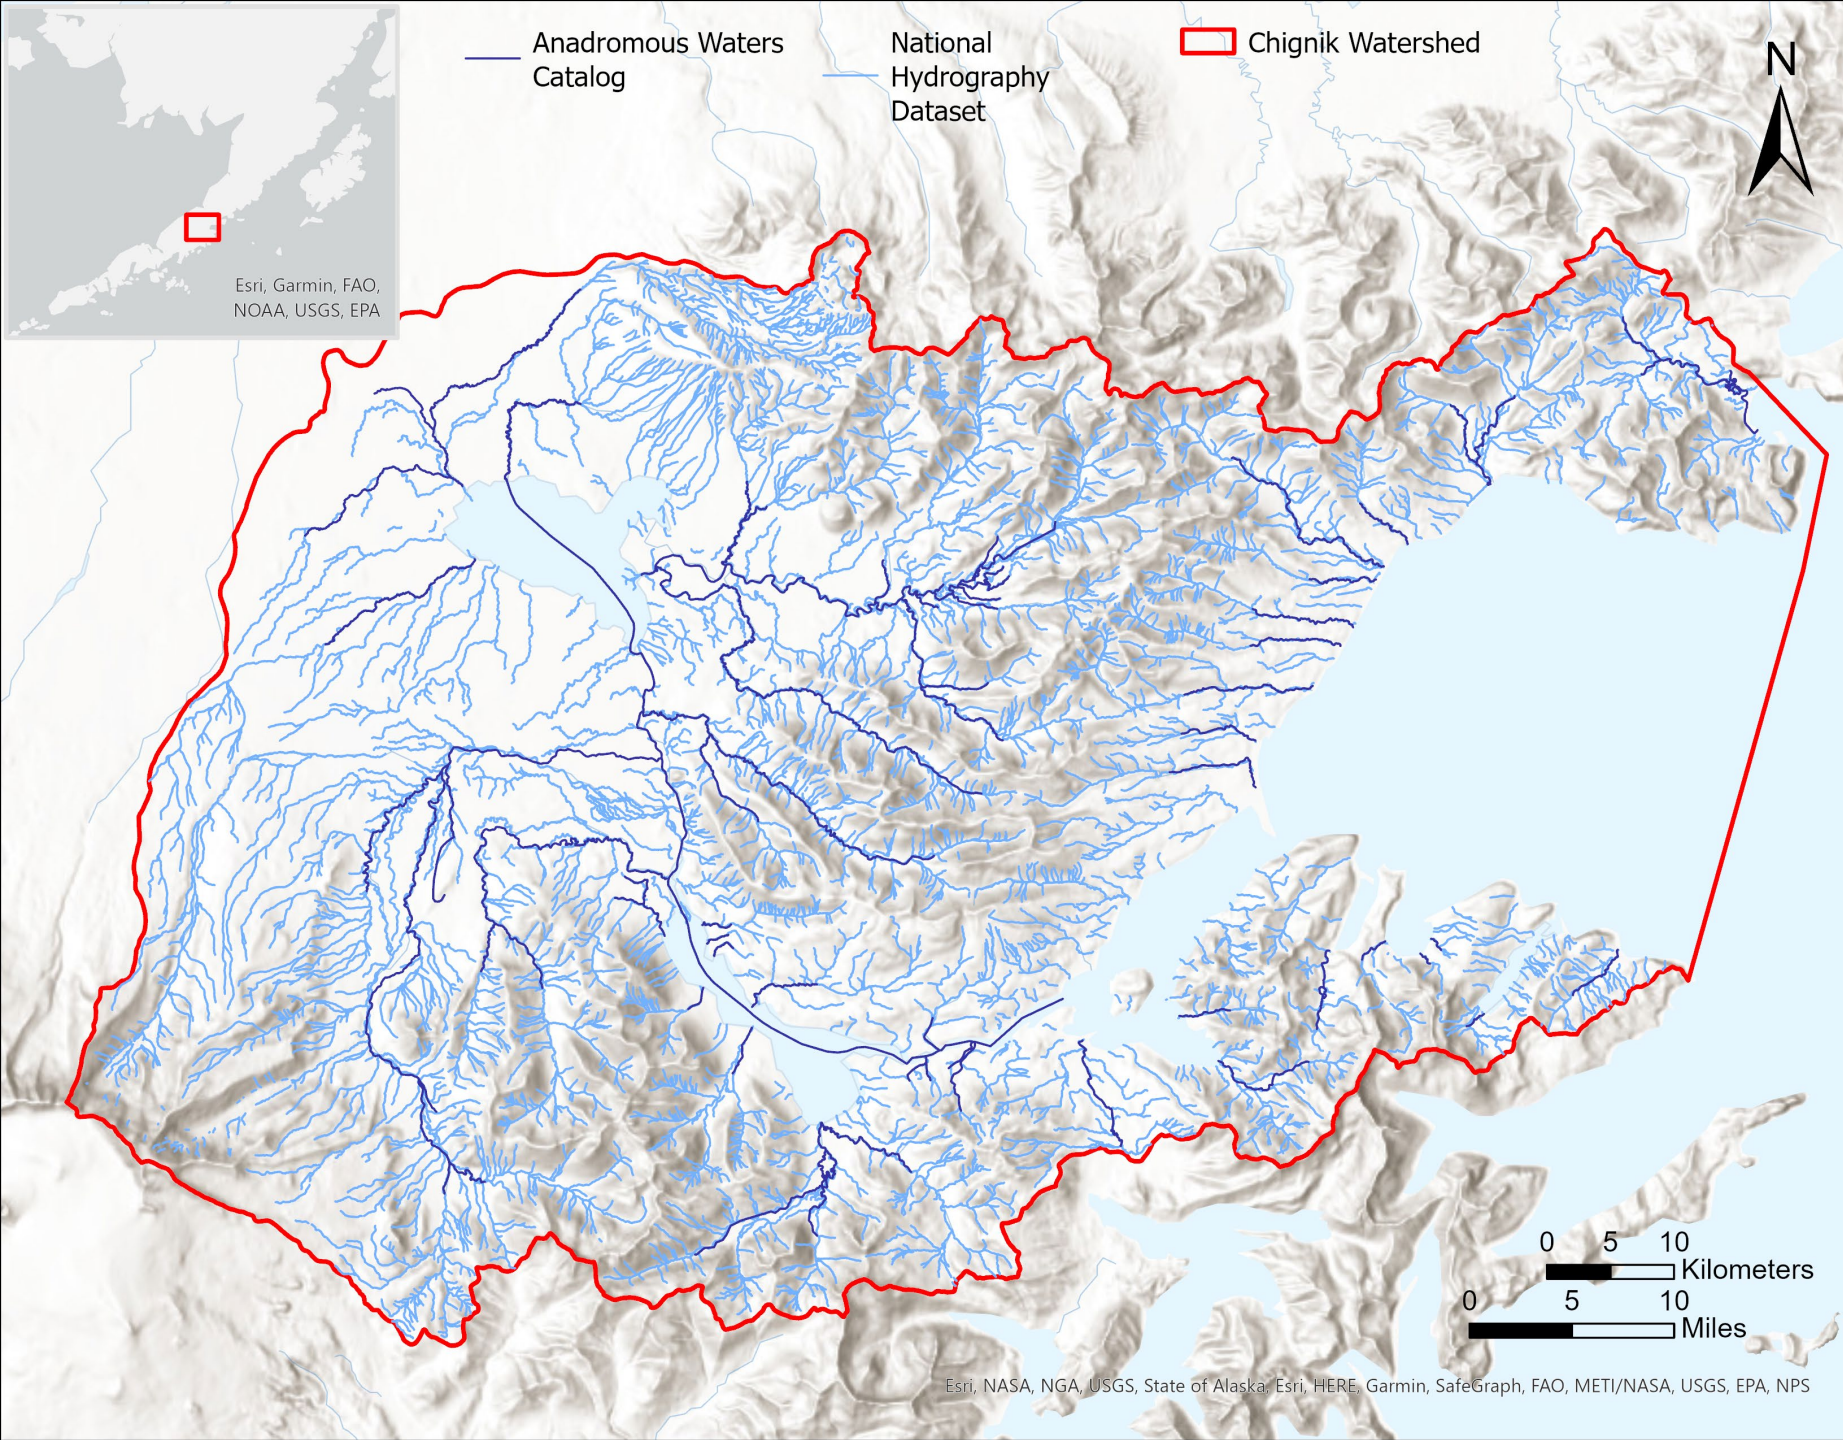

- Alaska needs high-resolution data
- Alaska communities rely on salmon for traditional food/resource-gathering
- Climate change has outsized effects at high latitudes and for Alaska

CHIGNIK WATERSHED

- **~1100 km**
"known" salmon
streams
- **small area; BIG**
productivity
- **Dynamic - habitat**
variability

CHIGNIK WATERSHED

- **~1100 km**
“known” salmon
streams
- **small area; BIG**
productivity
- **Dynamic - habitat**
variability

RESEARCH QUESTION

What is the spatial distribution and extent of “known” salmon streams in the Chignik watershed?

- Where are the important spawning/rearing sites?
- How can we assess & monitor change if we don't know all the streams that salmon use?

This situation is not unique...

...plenty of examples throughout the state

VIRTUAL WATERSHEDS

- Digital geospatial model of riverine environment
- Scalable: basin > subbasin > reach > micro...
- More accessible/easy

DEMs

- Base topographic data used for watershed delineation
- Gridded data containing x,y,z information
- Delineation accuracy increases w/ DEM resolution

1-2 meter resolution

5 meter resolution

Source: TerrainWorks *Benda et al.*

Preliminary delineation relies on Alaska Statewide Mapping Initiative's 5-m IfSAR DTM (digital terrain model) *in progress*

METHODS

LiDAR

- **L**ight **D**etection **A**nd **R**anging
- Sub-meter resolution, vertical accuracy

LiDAR acquisition flight survey (USGS 3DEP) scheduled spring 2023, ROI: ~125 square miles

HYDROGRAPHIC DATA

- Measuring flow

DIFFERENTIAL GPS

- RTK for GCPs
- Shallow water bathymetry

COMMUNITY BASED BATHYMETRY

- Local fish captains
- SONAR

UAS SURVEYS

- 3D model

GIS

- Put it all together!
- Processing, fusion, visualization, modeling, analysis

EXPECTED OUTCOMES

What is the spatial distribution and extent of “known” salmon streams in the Chignik watershed?

- Apply salmon habitat models and other inputs to watershed delineation & topobathy products

Black Lake

Thank you! Questions?

PROJECT OBJECTIVES PT. 1:

- ❑ Develop baseline topographic & bathymetric datasets**
- ❑ Update watershed delineation & stream networks**
- ❑ Identify salmon streams & any not currently registered in the AWC**

PROJECT OBJECTIVES PT. II:

- ❑ Incorporate LiDAR survey data into watershed delineation**
- ❑ Fusion of datasets**
- ❑ Salmon habitat modeling**
- ❑ Ground truthing of salmon streams**

2023 FIELDWORK:

May - June 2023

- Identify salmon sites with local knowledge
- Conduct UAS surveys to collect supplemental high-res imagery
- Conduct differential GPS surveys for bathymetric data in shallow areas
- Citizen-science hydrographic data collection training

PROJECTED OUTCOMES:

CHIGNIK WATERSHED

- **Datasets for and by local community members**
- **Updated and improved virtual watershed delineation**
- **Salmon habitat suitability model**
- **Topobathymetric model @ specific sites**
- **Future work**
